

What is Claimed is:

1. A method of modifying HMM models trained on clean speech with cepstral mean normalization to provide models that compensate for simultaneous channel/microphone distortion and background noise (additive distortion) comprising the steps of:

for each speech utterance calculating the mean mel-scaled cepstrum coefficients (MFCC) vector $\hat{\mathbf{b}}$ over the clean database;

adding the mean MFCC vector $\hat{\mathbf{b}}$ to the mean vectors $\mathbf{m}_{p,j,k}$ of the original HMM models where p is the index of PDF, j is the state, and k the mixing component to get in $\mathbf{m}_{p,j,k}$;

for a given speech utterance calculating an estimate of the background noise vector $\tilde{\mathbf{X}}$;

calculating the model mean vectors adapted to the noise $\tilde{\mathbf{X}}$ using $\hat{\mathbf{m}}_{p,j,k} = \text{IDFT}(\text{DFT}(\bar{\mathbf{m}}_{p,j,k} \oplus \text{DFT}(\tilde{\mathbf{X}})))$ to get the noise compensated mean vector where the Inverse Discrete Fourier Transform is taken sum of the Discrete Fourier Transform of the mean vectors $\bar{\mathbf{m}}_{p,j,k}$ modified by the mean MFCC vector $\hat{\mathbf{b}}$ added to the Discrete Fourier Transform of the estimated noise $\tilde{\mathbf{X}}$; and

calculating the mean vector $\hat{\mathbf{b}}$ of the noisy data over the noisy speech space, and removing the mean vector $\hat{\mathbf{b}}$ of the noisy data from the model mean vectors adapted to noise to get the target model.

2. The method of Claim 1 wherein the step of calculating the mean vector $\hat{\mathbf{b}}$ of the noisy data over the noisy speech space will calculate the vector using statistics of noisy model using: $\hat{\mathbf{b}} = \sum_p \sum_j \sum_k P_p(p)P_j(j|p)P_k(k|p,j)\hat{\mathbf{m}}_{p,j,k}$ where \mathcal{H} is the variable

denoting PDF Index J is the variable for the state index and \mathcal{K} is the variable for mixing component index

3. The method of Claim 2 wherein said calculating the mean vector $\hat{\mathbf{b}}$ uses equal probabilities for $P_{\mathcal{H}}(p)$

5

$$P_{\mathcal{H}}(p) = C.$$

4. The method of Claim 2 wherein equal probabilities for $P_{\mathcal{H}}(p)$, $P_{\mathcal{J}}(j|p)$ and $P_{\mathcal{K}}(k|h,j)$ is used.

10
100516400180
208700495007

$$P_{\mathcal{H}}(p) = C$$

$$P_{\mathcal{J}}(j|p) = D$$

$$P_{\mathcal{K}}(k|h,j) = E$$

15

5. The method of Claim 3 wherein mean vector $\hat{\mathbf{b}}$ becomes equal to:

$$\hat{\mathbf{b}} = IDFT(DFT(\mathbf{b}) \oplus DFT(\tilde{\mathbf{X}})).$$

20

6. A method of speech recognition with compensation for channel distortion and background noise comprising the steps of:

providing HMM models trained on clean speech with cepstral mean normalization;
for each utterance:

calculating the mean mel-scaled cepstrum coefficients (MFCC) vector $\hat{\mathbf{b}}$
over the clean database;

25

adding the mean MFCC vector $\hat{\mathbf{b}}$ to the mean vectors $\mathbf{m}_{p,j,k}$ of the original HMM models where p is the index of PDF, j is the state, and k the mixing component to get in $\mathbf{m}_{p,j,k}$;

for a given speech utterance calculating an estimate of the background noise vector $\tilde{\mathbf{X}}$;

calculating the model mean vectors adapted to the noise \tilde{X} using $\hat{m}_{p,j,k} = \text{IDFT}$
 (DFT ($\bar{m}_{p,j,k} \oplus \text{DFT}(\tilde{X})$)) to get the noise compensated mean vector where the Inverse Discrete
 Fourier Transform is taken sum of the Discrete Fourier Transform of the mean vectors $\bar{m}_{p,j,k}$
 modified by the mean MFCC vector \hat{b} added to the Discrete Fourier Transform of the estimated
 5 noise \tilde{X} ; and

calculating the mean vector \hat{b} of the noisy data over the noisy speech space, and
 removing the mean vector \hat{b} of the noisy data from the model mean vectors adapted to noise to
 get the target model; and

10 comparing the target model to the speech input utterance to recognize speech.

7. The method of Claim 6 wherein the step of calculating the mean vector \hat{b}
 of the noisy data over the noisy speech space will calculate the vector using statistics of noisy
 model using : $\hat{b} = \sum_p \sum_j \sum_k P_{\mathcal{H}}(p)P_{\mathcal{J}}(j|p)P_{\mathcal{K}|_{\mathcal{H},j}}(k|p,j)\hat{m}_{p,j,k}$ where \mathcal{H} is the
 variable denoting PDF Index J is the variable for the state index and \mathcal{K} is the variable for mixing
 component index

8. The method of Claim 7 wherein said calculating the mean vector \hat{b} uses
 equal probabilities for $P_{\mathcal{H}}(p)$

$$P_{\mathcal{H}}(p) = C.$$

9. The method of Claim 7 wherein equal probabilities for $P_{\mathcal{H}}(p)$, $P_{\mathcal{J}}(j|p)$
 and $P_{\mathcal{K}|_{\mathcal{H},j}}(k|p,j)$ is used.

$$P_{\mathcal{H}}(p) = C$$

$$P_{\mathcal{J}|\mathcal{H}}(j|p) = D$$

$$P_{\mathcal{K}|\mathcal{H},j}(k|p,j) = E$$

10. The method of Claim 9 wherein mean vector \hat{b} becomes equal to:

$$\hat{\mathbf{b}} = \text{IDFT}(\text{DFT}(\mathbf{b}) \oplus \text{DFT}(\tilde{\mathbf{X}})).$$

11. A speech recognizer with compensation for channel distortion and background noise comprising in combination:

5 adapted HMM models generated by modifying HMM models trained on clean speech with cepstral mean normalization wherein said models are adapted by:

for each utterance:

calculating the calculating the mean mel-scaled cepstrum coefficients (MFCC) vector $\hat{\mathbf{b}}$ over the clean database;

10 adding the mean MFCC vector $\hat{\mathbf{b}}$ to the mean vectors $\mathbf{m}_{p,j,k}$ of the original HMM models where p is the index of PDF, j is the state, and k the mixing component to get in $\mathbf{m}_{p,j,k}$;

for a given speech utterance calculating an estimate of the background noise vector $\tilde{\mathbf{X}}$;

15 calculating the model mean vectors adapted to the noise $\tilde{\mathbf{X}}$ using $\hat{\mathbf{m}}_{p,j,k} = \text{IDFT}(\text{DFT}(\bar{\mathbf{m}}_{p,j,k} \oplus \text{DFT}(\tilde{\mathbf{X}})))$ to get the noise compensated mean vector where the Inverse Discrete Fourier Transform is taken sum of the Discrete Fourier Transform of the mean vectors $\bar{\mathbf{m}}_{p,j,k}$ modified by the mean MFCC vector $\hat{\mathbf{b}}$ added to the Discrete Fourier Transform of the estimated noise $\tilde{\mathbf{X}}$; and

20 calculating the mean vector $\hat{\mathbf{b}}$ of the noisy data over the noisy speech space, and removing the mean vector $\hat{\mathbf{b}}$ of the noisy data from the model mean vectors adapted to noise to get the adapted model; and

25 means for comparing the adapted model to the speech input utterance to recognize the input speech

12. The recognizer of Claim 11 wherein the step of calculating the mean vector $\hat{\mathbf{b}}$ of the noisy data over the noisy speech space will calculate the vector using statistics of noisy model using : $\hat{\mathbf{b}} = \sum_p^y \sum_j \sum_k P_p(p)P_j(j|p)P_{k|j}(k|p,j)\hat{\mathbf{m}}_{p,j,k}$ where \mathcal{H} is the

variable denoting PDF Index J is the variable for the state index and \mathcal{K} is the variable for mixing component index 6. The model of Claim 5 wherein the step of calculating the mean vector $\hat{\mathbf{b}}$ of the noisy data over the noisy speech space will calculate the vector using statistics of noisy model using: $\hat{\mathbf{b}} = \sum_p \sum_j \sum_k P_{\mathcal{H}}(p)P_{\mathcal{J}}(j|p)P_{\mathcal{K}|j}(k|p,j)\hat{\mathbf{m}}_{p,j,k}$ where \mathcal{H} is the

5 variable denoting PDF Index J is the variable for the state index and \mathcal{K} is the variable for mixing component index

13. The recognizer of Claim 12 wherein said calculating the mean vector $\hat{\mathbf{b}}$ uses equal probabilities for $P_{\mathcal{H}}(p)$

$$P_{\mathcal{H}}(p) = C.$$

14. The recognizer of Claim 12 wherein equal probabilities for $P_{\mathcal{H}}(p)$, $P_{\mathcal{J}}(j|p)$ and $P_{\mathcal{K}|j}(k|p,j)$ is used.

$$P_{\mathcal{H}}(p) = C$$

$$P_{\mathcal{J}|\mathcal{H}}(j|p) = D$$

$$P_{\mathcal{K}|j}(k|p,j) = E$$

15. The method of Claim 12 wherein mean vector $\hat{\mathbf{b}}$ becomes equal to:

$$\hat{\mathbf{b}} = IDFT(DFT(\mathbf{b}) \oplus DFT(\tilde{\mathbf{X}})).$$

20 16. A method of speech recognition with simultaneous compensation for both channel/microphone distortion and background noise comprising the steps of:

modifying HMM models trained on clean speech with cepstral mean normalization;

for each speech utterance calculating the MFCC vector for a clean database;

adding this mean MFCC vector to the original HMM models;

estimating the background noise for a given speech utterance;

25 determining the model mean vectors adapted to the noise;

determining the mean vector of the noisy data over the noisy speech space; and

removing the mean vector of the noisy data over the noisy speech space from the model mean vectors adapted to the noise to get the target model.

17. A method of speech comprising the steps of:

providing HMM models trained on clean speech with cepstral mean normalization; and
modifying HMM models to compensate simultaneously for convolutive distortion and background noise.
